

Claims:

What is claimed is:

1. A system to enable communication between a server process and a client process in a graphical user interface environment of a computer system, comprising:

a server process for controlling the display of the graphical user interface;

a client process for communicating with a software application;
and

an agent for providing an interface between the server and the client, said agent receives input from the server process to perform an action with said software application and notifies the server process of the completion of the action.

2. The system of claim 1 wherein the server process is equipped to handle a plurality of agents.

3. The system of claim 1 further comprising:

a primary information source; and,

a cookie.

4. The system of claim 3 such that the cookie is used to filter the primary information source.

5. The system of claim 3 such that a play-list is generated by filtering the primary information source with the cookie's information.

6. The system of claim 1, further comprising:
an interface to accept an access information; and,
a verification system to authenticate the validity of the access information.

7. A method of enabling communication between a server process and a client process in a graphical user interface environment of a computer system, comprising:

providing a server process for controlling the display of the graphical user interface;

providing a client process for communicating with a software application; and,

providing an agent between the server and the client, said agent receives input from the server process to perform an action with said software application and notifies the server process of the completion of the event.

8. The method of claim 7 wherein the server process is equipped to handle a plurality of agents.

9. The method of claim 7 further comprising:
providing a primary information source; and,
providing a cookie.

10. The method of claim 9 such that the cookie is used to filter the primary information source.

11. The method of claim 9 such that a play-list is generated by filtering the primary information source with the cookie's information.

12. The method of claim 7, further comprising:
providing an interface to accept an access information; and,
authenticating the validity of the access information.
